

EmerGeo Mapping™

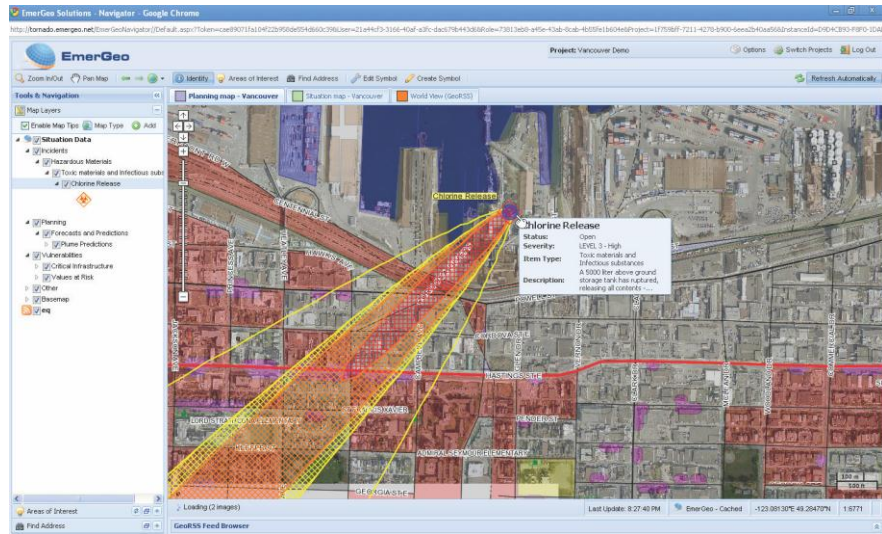

An Open Emergency Mapping Tool that Integrates with Customers' Existing GIS Systems, EmerGeo Fusionpoint™ and Google®

EmerGeo Mapping is more than a GIS mapping application. Its unique **managed Common Operating Picture (mCOP™)** technology is based on open standards and proven effective in helping government and industry to mitigate, prepare for, respond to and recover from emergencies, disasters, acts of terrorism or planned events.

Some of the most important lessons learned from major disasters, like the September 11th terrorist attacks, included the need to improve the way data is accessed and shared among emergency management organizations – commonly referred to as **interoperability**.

EmerGeo Mapping helps organizations achieve interoperability by:

- **Streamlining** communications by organizing and displaying data in standardized ways (e.g. data categorization and symbolization based on Homeland Security standards).
- **Guiding** users through standard planning and response processes using “wizards”.
- **Sharing** information through a role-based publishing function.
- **Integrating** data from multiple emergency management software applications and displaying in a common operating picture view.
- **Presenting** the right level of detail and functionality (tools) to the right role in each emergency organization.

EmerGeo Mapping includes:

EmerGeo Navigator™ – a simple, browser-based common operating picture client with simple drawing/plotting and publishing tools to provide a complete view of an emergency situation or major event. It is a ready-to-use application with live links to free and fee-based global map data that customers can easily customize to create an enhanced level of situational awareness.

EmerGeo Smart Client™ – a powerful desktop (mobile) application to manage, analyze, author and publish information on incidents, resources and operational activities among field and EOC users.

EmerGeo Mapping can work with simple or complex spatial data and services from virtually any vendor's web map server. EmerGeo builds on the OpenGIS® Consortium's open interoperability framework to reach across the network to publish and consume data from internal or external GIS applications. EmerGeo Mapping can be installed with or without the EmerGeo Fusionpoint software.
